

Automatic Urban Growth Detection for City Development

Presenter: Khaing Cho Moe

Outlines

- Introduction
- Objectives of the topics
- System Architecture
- Conclusion

Introduction

- The Geographic Information System is the indispensable role in the environmental changes detection and natural disaster management.
- According to 2014 Myanmar Nations' Census,
 - ✓ Total population is 51.4 millions
 - ✓ 14.9 million people living in urban areas
 - ✓ Yangon has the highest urban proportion about 70.1% (manual census result)detection.

Objectives of the topic

- To support a system that can be used for analyzing urban sprawl of Myanmar within ten years
- To implement a system that is capable of building extraction even for low resolution image
- To supply the specific information of urban increasing area with correct latitude and longitude position range
- To predict further growing rate of building areas in every place of Myanmar by testing current rate of rising percentage
- To be employed as a tool in many object-based environmental change detection application in GIS

System Architecture

Stage: 1 *(coordinate conversion with image registration)*

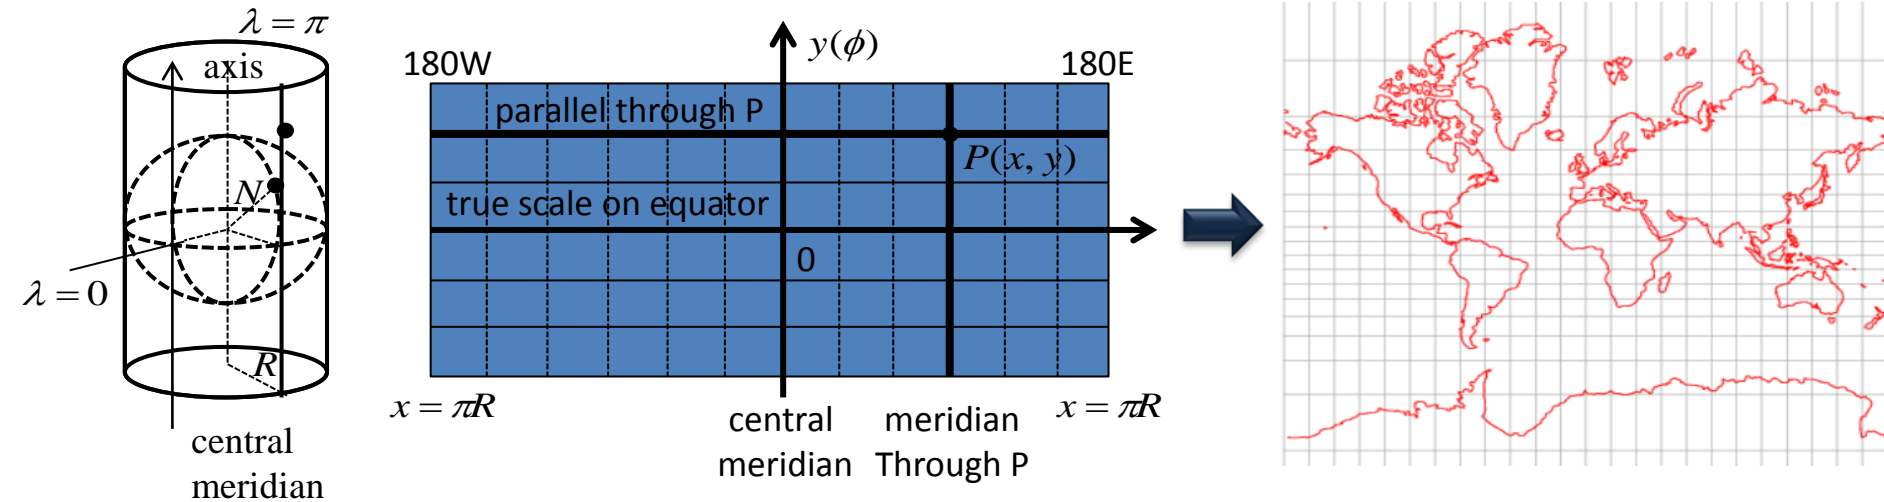

Figure: A cylindrical map projection

- A cylindrical map projection
- Linking the geographic coordinates of latitude ϕ and longitude λ to Cartesian coordinates on the map with the origin on the equator and x-axis along the equator.

Input

- Minimum latitude / longitude
- Maximum latitude / longitude
- Desired 4 control points with lat/long value

16°51' 34.92"
96°12' 3.93"

16°51' 24.92"
96°12' 13.93"

Steps of Image Registration

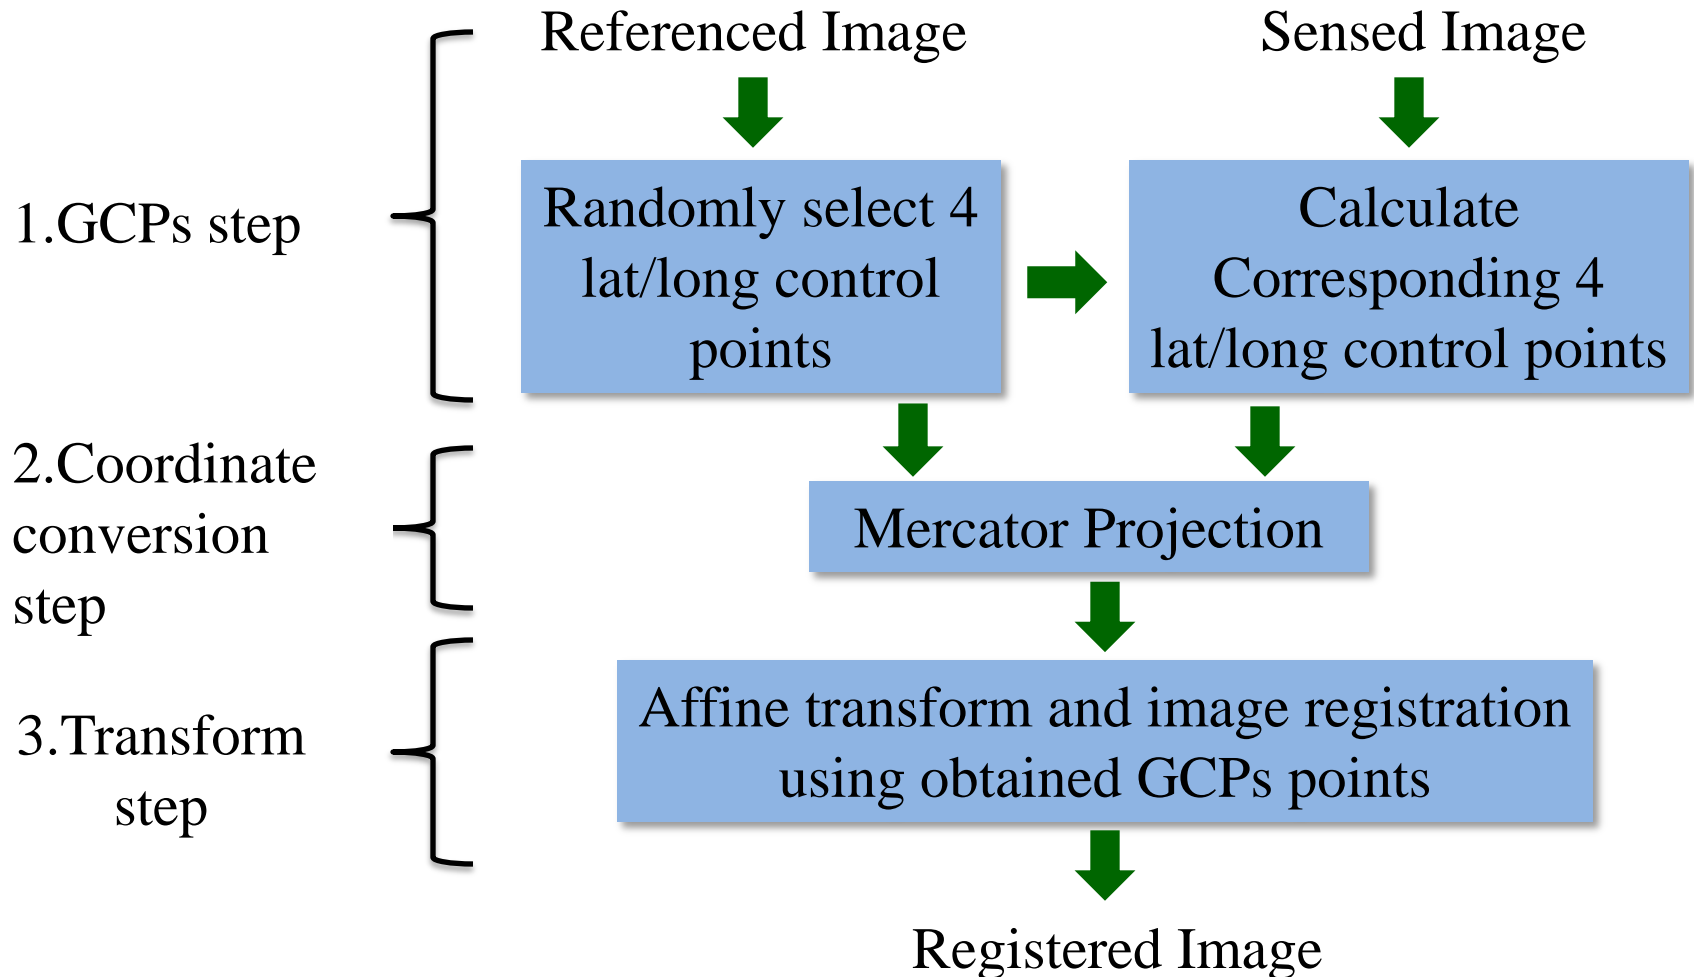

Figure: Example of Image Registration from North Dagon Township

Stage: 2 (*Building Extraction*)

Study area is located in latitude $16^{\circ}50' 4.73''$ /longitude $96^{\circ} 7' 23.98''$ and
latitude $16^{\circ}49' 54.73''$ /longitude $96^{\circ}7' 33.98''$

Input Image

SE=3

SE=7

SE=9

SE=11

Final Extracted Image

Image Registration of successive ten year images:

Building Area Extraction using modified MBI

1.044 sqtkm Range

Building Extraction

Select Year 2010

Extract

Detect

The diagram illustrates a workflow for building extraction. It begins with a 1.044 sqtkm range of an aerial image, which is then processed into a 3x3 grid of 27 images. The first column shows the original images, the second column shows the images after registration, and the third column shows the extracted building areas using a modified MBI method. A control panel on the left allows selecting the year (2010) and performing 'Extract' and 'Detect' operations.

Stage: 3 *(Testing for change or unchange)*

Input Area Image

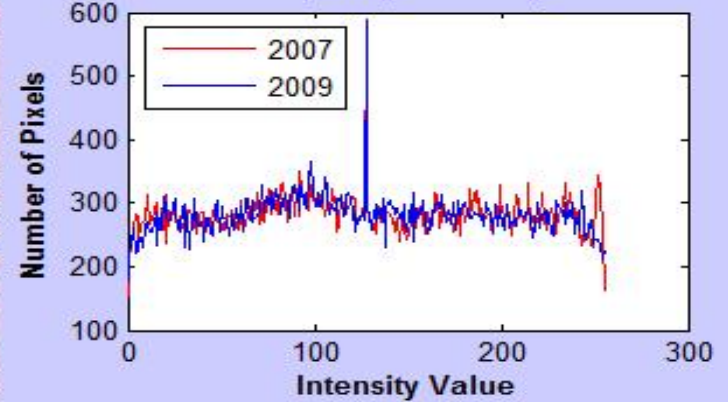

2003

2015

Comparing two images

	Year	1	2	3	4	5	6	7	8	9	10	11
1	2003-2004	No	No	Yes	No	Yes	No	No	No	No	Yes	No
2	2004-2005	Yes	Yes	Yes	Yes	No	No	No	Yes	Yes	Yes	No
3	2005-2006	Yes	Yes	No	Yes	No	No	No	Yes	No	Yes	Yes
4	2006-2007	Yes	No	No	Yes	No	No	No	Yes	Yes	Yes	No
5	2007-2009	No	Yes	No	Yes	No	No	No	No	Yes	Yes	No
6	2009-2010	No	Yes	Yes	No	No	Yes	No	No	No	Yes	No
7	2010-2013	Yes	No	Yes	No	No	No	Yes	Yes	Yes	Yes	Yes
8	2013-2014	No	No	No	No	No	No	Yes	No	Yes	Yes	No
9	2014-2015	No	No	No	No	Yes	No	Yes	No	No	Yes	No

Urban Change

Testing

Change Result

Detect

Stage: 4 (*Change Detection*)

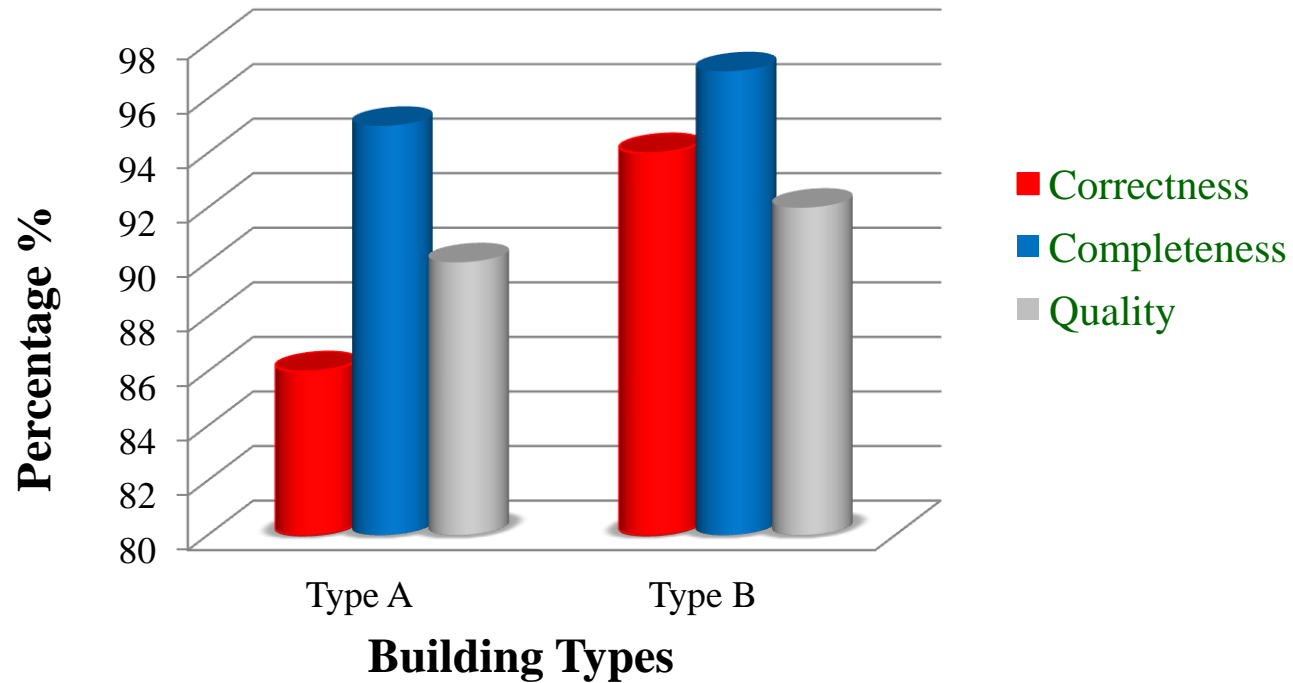

Increase/Change Building Area

- The total area growth of this region is **18.1937** times increase.
- In which the first five area development is more increase **2.2585** times than the second ones.

- The implementations are conducted on Google Earth satellite image and tested upon 1080 ten seconds (9 townships×12areas×10images) images.

Accuracy for building extraction

	Correctness	Completeness	Quality
Type A	86.23	95.67	90.76
Type B	94	97.43	92.89

Conclusion

- The system can solve necessity of human labor that is required for manual building change detection system.
- To get correct position of building index, combination of geometric coordinate and image registration is essentially needed.
- It is not an easy task to automatically extract buildings from satellite images without any supervised learning but geometric image registration and morphology based method are effective for indication of buildings and will benefits to process large amount of images.
- The system can also eases the government to find how area is free or already built and provides the free space of land to build.
- This system can also calculate damaged areas causing from natural disasters (flood, earthquake and so on).

Thanks for your attention
