

The project aims to develop several data-driven smart city applications on top of NICT's smart cross data platform, namely xData, collaboratively to demonstrate that the capabilities that can be enabled when several collaborators decide to share and reuse their resources, methods, models, and/or data, are greater than the sum of individual outcomes that can be achieved by isolated projects.

The different types of smart-city applications will demonstrate different aspects of the benefits of having a sharable, reusable, and knowledge-transferable platform to support the collaborative development of a smart community both in individual and regional scopes.
